Administration
BUREAU OF THE CENSUS

## Acknowledgments

This report was developed and prepared under the general direction of Patricia A. Johnson, Chief Social Characteristics Branch, Housing and Household Economic Statistics Division (HHES). Important professional contributions were made by Jeanne M. Woodward and Ruth M. Breads. Reita-Glenn Hacket provided statistical assistance. Leonard J. Norry, Assistant Division Chief for HHES, supplied overall direction.

We wish to express special gratitude to the Department of Housing and Urban Development which sponsors the American Housing Survey and to the Housing and Demographic Analysis Division, particularly its director, Duane T. McGough, and Connie Casey of his staff who reviewed the contents of the report. Additional persons within the Bureau of the Census also made significant contributions to the preparation of this report. William A. Downs reviewed its contents. Dennis J. Schwanz and James E. Hartman conducted the sampling review, and Mark Gorsak prepared the source and accuracy statement.

The staff of the Administrative and Publications Services Division, Walter C. Odom, Chief, performed publication planning, editorial review, design, composition, and printing planning and procurement. Frances B. Scott provided publication coordination and editing. Janet Sweeney provided design and graphics services.

# Our Nation's Housing in 1991 

## Introduction

Our Nation contains a diverse collection of housing. There is variety not only in the different types of structures, but also in the composition of the householdsthe people living in the units and their attributes. This report illustrates some of the demographic, economic, and physical housing characteristics of the 1991 national housing stock and its occupants. In the analysis and accompanying tables and charts, we summarize important similarities and differences evident in the Nation's housing among various age, race, and ethnic groups. The data are also presented separately by tenure since the housing conditions of owners and renters in America are often very different.

## Highlights

## The Housing Inventory

The figures in parentheses show the 90-percent confidence intervals.

- There were 104,591,000 housing units in the United States in 1991
- The largest share of all housing is located in the suburbs
- Of the four census regions, the South contains the largest proportion of the Nation's housing
- About 90 percent of U.S. housing is occupied

The report is based on data collected from the American Housing Survey (AHS) for the United States in 1991. The Bureau of the Census conducts this biennial national sample survey of approximately 50,000 housing units in the United States for the Department of Housing and Urban Development. The interviews are conducted from July through December of the survey year. The first AHS Survey was in 1973 and was called the Annual Housing Survey. After 1983, its name was changed to the American Housing Survey and it has since been conducted every other year in odd numbered years. See Current Housing Reports, H150/91 for crosstabulations of the extensive data collected from the AHS.

Appendices in that report also include the latest detailed survey sample design specifications and estimation procedures used for the AHS.

This report is arranged into four parts. The first part provides an overview of the current housing inventory. The second part shows current statistics for selected social, physical housing, and financial characteristics of occupied units or their households. The third section focuses on housing characteristics of occupied units constructed within the past 10 years. The final part of this report provides some important information about the Nation's vacant housing stock.

## Social Characteristics for Occupied Units

- Approximately 2 of every 3 householders own their home ( $64.2 \pm 0.4$ percent)
- The typical householder is 46 years old
- Owners are older than renters
- Homeownership is directly related to the age of the householder
- White householders are far more likely to be owners (67.9 $\pm 0.4$ percent), while Blacks and Hispanics are more likely to rent
their homes ( $57.2 \pm 1.3$ and $61.2 \pm 1.6$ percent, respectively)
- Married couples were the most common family household type ( $75.8 \pm 0.4$ percent) and they also had the highest homeownership rate ( $79.2 \pm 0.5$ percent)
- One-person households were the most common type of nonfamily household
- Women living alone were more likely to be homeowners (53.7 $\pm 1.1$ percent) than lone males ( $40.0 \pm 1.3$ percent)
- Owners maintain larger households than renters and households decrease in size as the
age of the householder increases
- Owners are more likely than renters to be married
- The relationship between educational attainment and homeownership is influenced by householder age
- Renters were five times as likely as owners to have moved recently ( $36.7 \pm 0.7$ compared with $7.0 \pm 0.3$ percent, respectively) and young householders are the most mobile ( $47.2 \pm 0.9$ percent among young renters, and $15.3 \pm 0.7$ percent among young owners)
- Homeowners and elderly householders have the most favorable opinions of their structures and the neighborhoods in which they live

## Physical Characteristics of Occupied Units

- Renters typically lived in multiunit structures and most owners lived in single units
- Half of all occupied homes in the United States were built after 1964
- Homeowners live in larger homes than renters
- Crowded living conditions are more evident among renters than owners ( $4.9 \pm 0.3$ compared with $1.5 \pm 0.1$ percent, respectively)
- Middle-aged homeowners lived in the most spacious homes
- Of the occupied homes in the United States with central heating systems, more than half ( $57.0 \pm 0.5$ percent) are heated by either piped or bottled gas
- Most homes are fairly well equipped with amenities and time-saving appliances
- Renters are more likely than owners to report some type of physical problem with their housing unit ( $11.2 \pm 0.4$ compared with $6.2 \pm 0.2$ percent, respectively)
- Owners are more likely than renters to have private transportation available

## Financial Characteristics for Occupied Units

- Owners have higher incomes than renters ( $\$ 34,801 \pm 358$ compared with $\$ 18,681 \pm 277$, respectively) and family income is highest among householders between 40 and 64 years of age ( $\$ 43,782 \pm 581$ among middle-aged owners, and $\$ 22,170 \pm 600$ among middleaged renters)
- Renters are about three times as likely as owners to maintain low-income households (23.5 $\pm 0.6$ compared with $8.4 \pm 0.3$ percent, respectively)
- Renters are more likely than owners to receive many of the different financial assistance and program benefits
- Homeowners were more likely than renters to report income from Social Security, pensions, and interest or dividends
- Many low-income households don't receive income assistance or other financial relief
- Homeowners with a mortgage have the highest monthly housing costs, but renters must spend a higher proportion of their income on shelter
- Middle-aged householders own homes with the highest value

## Characteristics of Occupied Units Built Since 1981

- One of every six occupied homes was built after 1980
- Fifty-eight ( $\pm 1.0$ ) percent of occupied homes built between 1981 and 1991 are located in the suburbs
- Younger householders tend to live in newer construction
- Units built from 1981 to 1991 are somewhat larger than all homes ( $1,787 \pm 29$ compared with $1,697 \pm 11$ median square feet, respectively)
- Households living in homes built after 1980 had higher family incomes than all households ( $\$ 35,769 \pm 808$ compared with $\$ 27,754 \pm 208$, respectively)
- Households in newer units paid more per month for housing ( $\$ 650 \pm 11$ ) and spent more of their income on shelter (23.6 $\pm 0.3$ percent) than all households ( $\$ 459 \pm 3$ and $21.9 \pm 0.2$ percent)

## Characteristics of Vacant Units

- Seven out of ten year-round vacant units are in metropolitan areas, with a fairly even mix between cities and suburbs
- Vacancy rates are highest in the South
- About half of all non-seasonal vacant units were either on the housing market for rent or for sale or recently rented or sold and awaiting occupancy
- The typical year-round vacant housing unit is $26.4( \pm 1.0)$ years old and has $1,270( \pm 38)$ square feet of living space with 4.3 ( $\pm 0.05$ ) median rooms including 2.0 ( $\pm 0.03$ ) bedrooms
- About one-quarter (23.9 $\pm 3.4$ percent) of vacant units for sale were on the housing market for at least 1 year

## Part 1 <br> The Housing Inventory

## An Overview

## The largest share of all housing is located in the suburbs

In. 1991, there were approximately 104.6 million housing units in the United States. Most (76 percent) of the Nation's housing is located inside Metropolitan Statistical

Figure 1.
Geographic and Regional Distributions of All
U.S. Housing Units: 1991

Areas (MSA's). ${ }^{1}$ Within these MSA's, the largest proportion of homes are in the suburbs (45 percent). About a third of all housing (31 percent) is located in central cities of MSA's. The remaining approximate quarter of all U.S. housing ( 24 percent) is located in areas outside of MSA's (figure 1).

Of the four census regions, the South contains the largest proportion of the Nation's housing

The largest proportion ( 35 percent) of the Nation's housing is in

[^0]the South. The next largest segment is in the Midwest where approximately one-quarter (24 percent) of all U.S. housing is located. The West and Northeast contribute the balance of the housing stock at about 20 percent each (figure 1).

## About 90 percent of U.S. housing is occupied

The large majority of U.S. housing units had persons living within them ( 93.1 million or 89 percent of all units). The remaining 11.4 million units were vacant at the time of the survey interview. Of these vacant units, 8.7 million were vacant year-round and 2.7 million were seasonal (figure 2). (See part 4 for a discussion of the characteristics of vacant units).

Figure 2.
Occupancy Status for All U.S. Housing Units: 1991

## Part 2

## Occupied Units

## Social Characteristics

## Approximately 2 of every 3 householders own their home

Approximately 64 percent (59.8 million units) of all householders ${ }^{2}$ in the United States attained the long-standing ambition of homeownership (figure 3). This includes units with one or more mortgages or those owned free and clear. The remaining 36 percent ( 33.4 million) of all occupied units were rented with or without payment of cash rent.

## The typical householder is 46 years old

Of all householders, half were roughly 46 years of age or younger while the other half were approximately that age or older (table A). Middle-aged householders, between 40 and 64 years of age, comprised 40 percent of all households. Slightly more than a fitth (22 percent) of the householders were elderly, or 65 years or older. Young householders, under 40 years of age, represented 38 percent of all occupied units (table 2).

## Owners are older than renters

Owners had a median age of about 50 years. Approximately half of all owners were between 40 and 64 years of age while about 25 percent were under 40 and a similar proportion were 65 years and older. The median age of renters was approximately 36 years. Most renters (59 percent) were less than 40 years old.

[^1]Twenty-eight percent of renters were between the ages of 40 and 64 , and only 14 percent were 65 years of age or older (table A).

## Homeownership is directly related to the age of the householder

Up until about 75 years of age, the likelihood of homeownership increases as the age of the householder increases. The youngest householder age group (under 20 years old) has the lowest level of homeownership (7 percent) (figure 3 , table A ). Homeownership rates increase steadily by age and peak for householders 55 to 74 years of age, reaching about 81 percent. Homeownership rates decline for householders in older age groups with 74 percent of householders 75 to 84 years and 67 percent of
householders 85 years and over owning their homes.

## White householders are far more likely to be owners, while Blacks and Hispanics are more likely to rent their homes ${ }^{3}$

About 85 percent of all householders were White and 12 percent were Black. Asian or Pacific Islanders (API) represented 2 percent of householders, while the remaining approximate 1 percent were either American Indian, Eskimo, or Aleut (AIEA), or any other race specified (table B).

[^2]Figure 3.
Homeownership Rates for Selected Householder Age Groups: 1991
(In percent)

Nearly 90 percent of the 59.8 million owners were White, while only 8 percent were Black. API householders accounted for 2 percent of all owners, while approximately 1 percent were AIEA or another race.

Blacks and other race groups were proportionately more represented among renters than owners. Of the 33.4 million renters in the United States, about 76 percent were White and 19 percent were Black. Three percent of renters were API and the balance (2 percent) were AIEA or any other race.

As there are differences in the racial composition of tenure categories, there are also differences in the homeownership rates among the different race groups.

Approximately two-thirds (68 percent) of White householders were owners, while only about 43 percent of Black householders owned their homes (figure 4).

For White householders under age 40, about half (49 percent) owned their homes. Middle-aged and elderly Whites had similar homeownership rates (about 79 percent). Homeowners accounted for only 25 percent of young Black householders and 54 percent of middle-aged Blacks. Among Blacks, the elderly householder group had the highest rate of homeownership ( 64 percent).
The 6.2 million Hispanic-origin householders represented 7 percent of the Nation's households in 1991. Householders of Hispanic origin constituted 4 percent of all

owners and 11 percent of all renters.

About 4 out of every 10 Hispanic householders owned their homes, while approximately two-thirds (66 percent) of their non-Hispanic counterparts were homeowners (figure 4). The homeownership rate for young Hispanic householders was 25 percent. For middle-aged and elderly Hispanics, homeownership rates were 52 and 59 percent, respectively. ${ }^{4}$

## Married couples were the most common family ${ }^{5}$ household type and they also had the highest homeownership rate

About 7 out of 10 or 66.2 million of the Nation's 93.1 million households were family households. Married-couple households were the most common living arrangement, representing 76 percent of all family households. About 11.9 million family households (18 percent) were maintained by women without spouses living with them, while 4.1 million ( 6 percent) were maintained by men without spouses in their household (figure 5).
Married householders were generally older than other female and other male family householders. Householders under 40 years old represented 37 percent of mar-ried-couple family households and about 45 percent of other female and other male family households. Likewise, 46 percent of married-couple family households were between 40 and 64

[^3]years of age, while only about 40 percent of other female and other male family households also had householders in this age range. Approximately 18 percent of mar-ried-couple family householders and approximately 15 percent of other female and other male family householders were 65 years of age or older.

Married-couple family householders had a higher homeownership rate than family households maintained by either women or men without spouses. Among mar-ried-couple family households, about 79 percent owned their homes. For other female family households, the homeownership rate was 45 percent. Among male family householders without spouses, about 60 percent were homeowners (figure 6).

Of all family households, about half (51 percent) included children under 18 years old. The homeownership rate for this specific household group was 64 percent. Among the 49 percent of family households without any children, homeownership was more prevalent ( 81 percent).

## One-person households

 were the most common type of nonfamily householdThere were 27.0 million nonfamily households in the United States in 1991, representing 29 percent of all households. Most of these households ( 22.4 million or 83 percent) contained just one person - the householder. The 4.6 million householders living exclusively with nonrelatives represented the other portion of nonfamily households (figure 5).
While most two or more person nonfamily households had householders under 40 years old ( 71 percent), the largest proportion of

(In percent)

Figure 5.
Distribution of Family and Nonfamily Households: 1991

Figure 6.
Homeownership Rates for Selected Household Types: 1991
(In percent)
Family households

Figure 7.
Median Household Size, by Tenure and Age of Householder: 1991 (Number of persons)

Under 40 years 40 to 64 years 65 years and over

householders living alone were 65 years and over ( 40 percent).

## Women living alone were more likely to be homeowners than Ione males

Overall, the homeownership rate was higher for females living alone (54 percent) than it was for their male counterparts (40 percent) (figure 6). For young householders living alone, men were more likely to own their home (24 percent) than were women (16 percent). Among those middle-aged, 56 percent of women and 44 percent of men who lived alone owned their homes. Among the elderly living alone, homeownership rates of men and women were not significantly different from each other (about 64 percent).

## Owners maintain larger households than renters and households decrease in size as the age of the householder increases

The median number of persons in occupied units was 2.3. Generally, households maintained by owners were larger than those of renters. For owners, the median household size was 2.4 persons. Among renters, the median was 2.0 persons (figure 7).

As the age of a householder increases and there is less likelihood for children to be present, household sizes commonly are smaller. Among young householders, the median household size was 2.8 persons. For middle-age and elderly householders, median household sizes were 2.5 and 1.6 persons, respectively.

## Owners are more likely than renters to be married

In 1991, over half (55 percent or 51.2 million) of all householders

were married. Divorced or separated marital statuses were reported by 17 percent of householders while 15 percent had never married. Widowed householders constituted the remaining approximate 12 percent of all householders (figure 8).

About twice the proportion of owners were married (67 percent) when compared with renters (33 percent). Renters tend to have higher rates of never being married (31 percent) and divorced or separated ( 26 percent). For owners, 7 percent had never married and 12 percent were divorced or separated. There was a higher proportion of owners who were widowed (14 percent), than the 10 percent of renters who lost their spouse through death (figure 8).

Nearly 4 of every 5 married householders ( 79 percent) were owners. About 71 percent of widows and widowers also owned their homes. Among household-
ers divorced or separated, less than half were homeowners (45 percent). Only 29 percent of householders who had never married were owners.

## The relationship between educational attainment and homeownership is influenced by householder age

About 21 percent of all householders did not complete high school. Approximately 36 percent graduated from high school, 19 percent had at least some college, and 24 percent were college graduates (table 2).

Young householders were generally better educated than householders in the other age groups. Approximately 12 percent of householders under 40 years of age did not graduate from high school. However, among middleaged and elderly householders, about 18 and 41 percent, respectively, did not receive a high
school diploma or its equivalent. Roughly 27 percent of householders under 40, as well as those aged 40 to 64 , were college graduates. Proportionately only about one-half as many elderly finished college (14 percent). The likelihood of owning a home appears to be related to the level of education completed, although the difference is less distinct among older householders. Overall, about 59 percent of householders who did not finish high school were homeowners in 1991. For college graduates, the homeownership rate was approximately 70 percent (figure 9). Among just the young, 27 percent of householders who didn't finish high school and 53 percent with a college degree owned their homes. This creates a homeownership gap of about 26 percentage points between educational groups among the young. For householders 65 years or older, the homeownership gap

Under 40 years (In percent)

40 to 64 years
65 years and over

was much smaller at only 12 percentage points. About 73 percent of elderly householders without a high school diploma and 85 percent with at least a college degree were homeowners.

Renters were five times as likely as owners to have moved recently and young householders are the most mobile
About 18 percent ( 16.4 million) of all householders changed residence within the year before interview. Renters were much more likely than owners to move. More than a third ( 37 percent) of renters were recent movers, while the rate among owners was only 7 percent (figure 10).

Among owners, 15 percent of householders under 40 years of age were recent movers. For middle-aged and elderly homeowners, 5 and 2 percent, respectively, changed residence within the past year. About half ( 47 percent) of renters less than 40 years of age moved into their homes the year preceding interview. Mobility was still fairly high for middle-aged renters (27 percent). Among elderly renters, the proportion who were recent movers was just 12 percent.
Thirty-seven percent ( 1.5 million) of all recent-mover owners were first-time homebuyers. For homeowners less than 40 years old, over half ( 53 percent) of those who moved in the year before interview purchased their first home. For recent-mover elderly householders, only 7 percent had bought their first home.

Recent-Mover Status, by Age of Householder and Mortgage Status for Owner-Occupied Units: 1991
(Numbers in thousands, except percents)

## Homeowners and elderly householders have the most favorable opinions of their structures and the neighborhoods in which they live

About 73 percent of respondents were very satisfied with the structures in which they lived, giving them a high rating ${ }^{6}$ (figure 11). Owners were more likely to have a positive opinion of their housing units, with 83 percent giving them a high rating. Among renters, a much lower 59 percent were as content with their structures. Households maintained by elderly householders more often rated their structures higher than households with householders in the other age groups. A high opinion of structure was given by 81 per-
${ }^{6} \mathrm{~A}$ high rating is a rating of anywhere from 8 to 10 , based on a scale of 1 to 10 , where 10 is best and 1 is worst. Not reported responses are included in the denominator when calculating proportions.
cent of elderly, 77 percent of middle-aged, and 64 percent of young householders (table E).
Approximately 69 percent of respondents gave their neighborhoods a high rating. About threequarters of owners ( 75 percent) and 58 percent of renters were
very pleased with the neighborhoods in which they lived. About 76 percent of elderly houśeholders had a high opinion of their neighborhoods, while 71 and 62 percent of middle-aged and young householders, respectively, gave them similar ratings.

## Physical Housing Characteristics

Renters typically lived in multi-unit structures and most owners lived in single units

One-unit structures account for approximately two-thirds (68 percent) of all housing units. About one-quarter ( 26 percent) are mul-ti-unit structures and the remainder (6 percent) are mobile homes or trailers (figure 12).

Owners were far more likely than renters to live in single-unit structures. About 87 percent of all owner-occupied housing consisted of individual units which were either attached or detached housing. Among renters, the proportion in this type of structure was about one-third (33 percent).

Conversely, approximately twothirds (63 percent) of renters lived in structures with two or more units. About 23 percent of all renters were in structures with 2 to 4 units, 32 percent lived in structures with between 5 and 49 units, and 9 percent in buildings with 50 or more units.

Overall, young householders were more inclined than householders in other age groups to live in mul-tiple-unit structures. About 37 percent of householders under 40 years of age occupied structures of two or more units. This compares with 19 percent of middle-aged and 22 percent of householders 65 years or older living in multi-unit structures (table 3).

Specifically among renters, almost 72 percent of elderly householders lived in structures of more than one unit. This was higher than the proportion of renters under 40 ( 63 percent) and renters between 40 and 64 years of age
(60 percent) living in multi-unit structures.

## Half of all occupied homes in the United States were built after 1964

The median age of all occupied homes in the United States in

1991 was about 27 years. Owner-occupied units were slightly newer than renter-occupied housing (26 and 28 median years, respectively) (figure 13). Owners were also more likely to be living in new construction, that is, units built in the prior 4 years ( 6 percent). About 4 percent of

Figure 12.
Distribution of Units in Structure, by Tenure: 1991
(In percent)

Figure 13.
Median Age of Home, by Tenure and Age of Householder: 1991 (In years) 65 years and over and

renter-occupied housing was new construction. (See part 3 for a discussion of the characteristics of housing built in the prior 10 years).

Among homeowners, elderly householders lived in the oldest housing. Homeowners 65 years of age or older were in structures with a median age of about

Figure 14.
Households With More Than One Person Per Room, by Tenure and Age of Householder: 1991
(In percent)

Figure 15.
Median Living Area of Single Detached and Mobile Homes, by Tenure and Age of Householder: 1991
(In square feet)

35 years. The median age of homes owned by middle-aged and young householders were approximately 24 and 18 years, respectively.
Particularly among renters, though, middle-aged householders lived in homes with the highest median age (about 30 years). Elderly and young renters lived in homes with a similar median age, 27 years.

## Homeowners live in larger homes than renters

A median of 5.4 rooms was found in our Nation's occupied homes. Among owner-occupied units, there were 6.1 rooms. The median number of rooms in rented units was 4.2. The same disparity exists between owners and renters in the median number of bedrooms in their homes. For owners, there were 2.9 bedrooms and among renters, a median of 1.9 bedrooms were present (table 3).
Two-thirds (66 percent) of owneroccupied homes had more than one bathroom available. Among renters, only about one-quarter (26 percent) had more than one bathroom.

## Crowded living conditions are more evident among renters than owners

About 3 percent of all occupied units had more than one person per room (a characteristic often used to indicate overcrowding). About 2 percent of owners lived in crowded conditions. Among renters, 5 percent maintained households with more than one person per room (figure 14).
Crowding is less common among the elderly due to their greater likelihood of living alone. Among owners, 2 percent of households with householders under 40 years
old or householders 40 to 64 years old lived in units with more than one person per room. For owners 65 and over, less than 1 percent were crowded. For renters, about 5 percent of young and middle-aged householders maintained crowded households. For elderly renters, only about 1 percent maintained households with more than one person per room.

## Middle-aged homeowners lived in the most spacious homes

There was a median of approximately 1,700 square feet of living space in occupied units in $1991 .{ }^{7}$
${ }^{7}$ Data for square footage is only collected for single detached units and mobile homes. Therefore discussion of this characteristic only applies to these types of units.

Owners generally had a great deal more room in their homes than renters. Owned homes had approximately 1,775 median square feet, while rented homes had about 500 square feet less, or 1,255 median square feet of living space (figure 15).

Although owners had more persons in their homes, they still had more space available per person.

There was a median of 700 square feet per person in owneroccupied units, while renters had 475 median square feet per person.

Middle-aged homeowners lived in units with the most living space.

The median amount of living area in homes owned by householders 40 to 64 years of age was about 1,900 square feet. For households maintained by homeowners under 40 years of age, there was about 1,700 median square feet

Figure 16.

(In percent)
Under 40 years 40 to 64 years 65 years and over

of living space. Among households maintained by householders 65 years of age and over, there was a median of about 1,600 square feet.

## Of the occupied homes in the United States with central heating systems, more than half are heated by either piped or bottled gas

About 88 percent ( 82.0 million) of occupied homes across the Na tion have a central heating system. ${ }^{8}$ Of these homes with central heat, 57 percent use piped or bottled gas as the main fuel source. About 28 percent are heated by electricity, 14 percent by either fuel oil or kerosene, and 1 percent by coal, coke, or wood. Homes with central heating systems in the South are primarily heated by electricity ( 51 percent). The large majority of centrally heated homes in the Midwest (78 percent) use piped or bottled gas as the main fuel source (table F).

Of the 10.3 million occupied homes without a central heating system, about 40 percent were heated by piped or bottled gas and a similar proportion were heated by coal, coke, or wood. More than half ( 5.8 million) of the units without central heat are located in the generally temperate South, but account for only 18 percent of occupied homes in that region. Twelve percent of homes occupied in the West lacked central heat. Of the occupied housing in the colder climates of the Northeast and Midwest, only about 5 percent were without central heating systems.

[^4]
## Most homes are fairly well equipped with amenities and time-saving appliances

Nearly all occupied units in the United States (99 percent) have complete kitchen facilities. About three-quarters (76 percent) have a clothes washer and a slightly smaller proportion (69 percent) have clothes dryers. The large majority of occupied units (94 percent) have telephones available. About two-thirds ( 66 percent) have all of the above selected equipment (table 3).
When examined by tenure, owners were much more likely than renters to have homes with all of these specified conveniences. About 85 percent of owners reported having all selected equipment in their homes, compared with about a third ( 34 percent) of all renters.

## Renters are more likely than owners to report some type of physical problem with their housing unit

About 8 percent of the occupied units in the United States had physical problems. Most of these
units (5 percent) had moderate physical problems. To a lesser extent, 3 percent of occupied units had severe physical problems. ${ }^{9}$ A greater proportion of renters reported living in units with either moderate or severe physical housing problems (11 percent) than owners (6 percent) (figure 16).
Among renters specifically, units with householders between 40 and 64 years of age had the highest likelihood of reporting physical housing problems (13 percent). About 10 percent of young householders and a similar proportion of elderly householders had either moderate or severe physical problems with the units they lived in.

[^5]
## Owners are more likely than renters to have private transportation available

About 11 percent of all households didn't have a car, truck, or van available for transportation. Renters were far more likely than owners to report a lack of private transportation (22 compared with 5 percent, respectively) (figure 17).
As householders age, especially among renters, private means of transportation becomes increasingly less available. About half (47 percent) of renters aged 65 years or older did not have a car, truck, or van available. For young renters, 16 percent were without private transportation. For middle-aged renters, approximately 22 percent were without cars, trucks, or vans.

About 3 out of every 10 households (29 percent) had two or more cars, trucks or vans. Among owners, approximately one-third (34 percent) had more than one available means of private transportation. Renters were less likely to have two or more vehicles (19 percent).

## Financial Characteristics

## Owners have higher incomes than renters and family income is highest among householders between 40 and 64 years of age

The median gross income of all U.S. families or primary individuals was about $\$ 27,800$ in 1991. The median income of renters was $\$ 18,700,46$ percent lower than the estimated median for owners ( $\$ 34,800$ ) (figure 18).
Median family income was higher for households located in MSA's $(\$ 29,400)$, than for those
classified as living outside MSA's $(\$ 22,300)$. Among those households in MSA's, median family income was higher for those in suburbs ( $\$ 33,600$ ), than it was for those living in central cities $(\$ 24,500)$ (table 4).

Young householders maintained households with a slightly lower median family income than middle-aged householders, but still about double that of elderly householders. The median family income of owners under 40 years of age was about $\$ 41,700$. For homeowners between 40 and 64
years old, the median was about 5 percent higher, or $\$ 43,800$. The median income of owners over 65 years of age was $\$ 18,400$. Young renters had a 1991 median family income of $\$ 20,000$. The income of middle-aged renters was about 11 percent higher, or \$22,200. For elderly renters, however, median family income amounted to $\$ 9,600$.

Householders under 40 generally have more persons in their households than middle-aged and elderly householders (2.8 compared with 2.5 and
1.6 median persons). We might expect these larger households to have higher incomes, considering they could have more potential wage earners. This doesn't appear to be the case since much
of the difference in household sizes is reflected by the increased presence of dependent children or non-income contributing members in many of the young households.

Figure 18.

(In dollars)
Under 40 years 40 to 64 years 65 years and over

Figure 19.
Households With Low Income, by Tenure and Age of Householder: 1991 (In percent)

Renters are about three times as likely as owners to maintain low-income households ${ }^{10}$
Fourteen percent of all households were low-income households in 1991. This rate was much lower among owners ( 8 percent) than among renters (24 percent) (figure 19).
Householders 65 years and over were more likely to maintain lowincome households than those in other age groups. Among owners, 14 percent of elderly households were low-income. For young and middle-aged owners, 6 and 7 percent, respectively, had low income. Among renters, 29 percent of households maintained by persons 65 years and over had low income. Proportions of low-income households for young and middle-aged renters were 23 and 21 percent, respectively.

## Renters are more likely than owners to receive many of the different financial assistance and program benefits

About 14 percent of renters received welfare or SSI payments and a slightly larger proportion reported receiving food stamps.

[^6]Homeowners were less apt to receive these types of assistance (about 3 percent). ${ }^{11}$ Among renters, this financial assistance was utilized most by the youngest age group. Seventeen percent of renters under 40, 15 percent of middle-aged renters, and 11 percent of elderly renters obtained food stamps to supplement their incomes (table G).

[^7]Fourteen percent of renters lived in public housing, received a Federal or State financial rent subsidy, or reported that their rent was set as a specified proportion of their income. ${ }^{12}$ This type of housing assistance was more common for elderly renters (29 percent), than
${ }^{12}$ For further information about housingassisted households, see the biennial report by Connie H. Casey, Housing and Urban Development, Characteristics of HUD-Assisted Renters and Their Units in 1989, HUD-1346-PDR, Released March, 1992.
middle-aged or young renters (about 12 percent).

## Homeowners were more likely than renters to report income from Social Security, pensions, and interest or dividends

Thirty-six and 20 percent of homeowners and renters, respectively, reported income from Social Security or pensions. Thirtyone percent of owners and 9 percent of renters reported income from interest or dividends. Social Security or pension income was very common for both elderly

[^8]owners and renters. About 97 percent of homeowners and 94 percent of renters aged 65 years or older reported this type of income.

Interest or dividend income is more important and widespread among older householders. Among homeowners, 15 percent of householders under 40, 29 percent between 40 and 64 years of age, and about half (51 percent) of the elderly reported this income source. Among renters, 5 percent of young, 9 percent of middle-aged, and about a quarter (26 percent) of householders 65 years or over received income or dividend income.

## Many low-income households don't receive income assistance or other financial relief

As we should expect, program benefits were higher among those who need them most - low-income households. But many of these households in poverty conditions failed to receive income assistance or financial relief.

For instance, only about 41 percent of all low-income renters received welfare or SSI payments. For this same group, half ( 50 percent) reported obtaining food stamps. About one-third (34 percent) of low-income renters lived in public or subsidized housing (table G).

Figure 20.

Homeowners with a mortgage have the highest monthly housing costs, but renters must spend a higher proportion of their income on shelter

The median monthly housing cost for all occupied units in the United States was $\$ 459$ in 1991. This median cost was the same for owners ${ }^{13}$ as well as renters ${ }^{14}$, however there are broad differences between housing costs borne between owners with mortgaged and non-mortgaged homes. For the 55 percent of owners who had at least one mortgage on their home and reported housing costs, a median of $\$ 761$ per month was allocated toward costs for housing. For owners who did not have any mortgages on their home, the median monthly housing cost was 71 percent less, or $\$ 222$ (table 4).

Among mortgaged units, the median monthly housing cost was highest among the youngest age group. They paid about $\$ 801$ per month while middle-aged and elderly homeowners spent medians of $\$ 762$ and $\$ 549$ per month, respectively. Young and middleaged renters had similar median monthly housing costs (approximately \$475). Costs for housing

[^9]were less for elderly renters, or $\$ 360$ per month. ${ }^{15}$
One way to measure housing cost burdens is to determine what proportion of current family income is consumed by costs related to housing. Overall, the households in our Nation spend a median of about 22 percent of family income on housing. Renters spend more of their income on housing than owners who mortgage their homes and those without mortgages. Twenty-eight percent of family income was consumed by housing costs among renters. For owners with a mortgage on their home, 22 percent went toward housing. Among owners who owned their homes free and clear, the median monthly housing cost as a proportion of current family income was only about 13 percent (figure 20).
Elderly renters face the largest housing cost burdens. Thirtyseven percent of family income was spent on housing for this age-specific group. ${ }^{16}$ For both young and middle-aged renters, housing costs as a proportion of income was about 27 percent.

[^10]Among homeowners with at least one mortgage, monthly housing costs as a proportion of family income were 24 percent for householders under 40, 21 percent for middle-aged householders, and 29 percent for elderly householders. For nonmortgaged homes, housing costs amounted to 9,10 , and 16 percent of current family income for young, middle-aged and elderly homeowners, respectively.

Figure 21.
Median Value of Owned Homes, by Age of Householder: 1991 (In dollars)

## Middle-aged householders own homes with the highest value

The 1991 median value of owneroccupied homes in the United States was $\$ 80,000$. There was great diversity in values depending on where units were located. Inside MSA's, the median value of owner-occupied homes was $\$ 92,200$. In suburbs, home values were higher than in central cities (\$98,700 compared with $\$ 78,100$ ). Outside of MSA's, home value was lowest, reflected by a median of about $\$ 51,900$ (table 4).
The median value of homes owned by householders 40 to 64 years of age was the highest ( $\$ 87,900$ ). Householders under 40 years of age owned homes with a median value of $\$ 77,900$. The median value of homes owned by elderly householders was the lowest $(\$ 70,400)$ (figure 21).
A similar relationship occurs inside MSA's as well; however outside MSA's homes owned by young householders had the lowest median value ( $\$ 46,600$ ). Middle-aged and elderly householders owned homes outside of MSA's with a median value of $\$ 57,200$ and $\$ 49,500$, respectively.

## Part 3 <br> Occupied Homes Built 1981-1991

## Characteristics of Occupied

 Units Built Since 1981
## One of every six occupied

 homes was built after 1980There are about 16 million occupied housing units in the U.S. that were built between 1981 and 1991. These units account for about 17 percent of the 1991 occupied housing stock. Most of the construction that has occurred after 1980 and is now occupied consists mostly of owner-occupied housing ( 10.7 million units or 67 percent) (figure 22).

Of the units built since 1981, 70 percent were built between 1981 and 1987, 17 percent in 1988 or 1989, and 13 percent most recently (built in 1990 or by time of survey interview in 1991).

## Fifty-eight percent of occupied homes built between 1981 and 1991 are located in the suburbs

Approximately 80 percent of the occupied homes built since 1981 are inside MSA's. About 58

Figure 22.
Occupied Units, by Year Structure Built: 1991

percent have been built specifically in suburban areas, higher than the proportion of all occupied homes located in the suburbs (46 percent). Approximately 22 percent of homes built after 1980 are in central cities. This is lower than the proportion of all occupied units found in cities (32 percent) (table 5).

## Younger householders tend to live in newer construction

Housing units built since 1981 had householders who had a median age of 39 years. This was significantly younger than the median age of all householders (46 years).
The median age of owners living in housing built between 1981 and 1991 was 41 years. For renters, it was 33 years. Among all owners and renters, the median ages were 50 and 36 years, respectively (table 5).

Units built from 1981 to 1991 are somewhat larger than all homes

There was about 1,790 median square feet of living space in the 10.0 million single detached and mobile homes built after 1980 . These homes are slightly larger in size than all occupied single detached and mobile homes (about 1,700 median square feet).
Homes built from 1981 to 1987 have about the same amount of living area as all occupied single detached and mobile homes (about 1,700 median square feet). However, for units built since 1988 there is generally more living space, amounting to some 1,900 median square feet (table 5).

## Households living in homes built after 1980 had higher family incomes than all households

The median family income of households living in homes built
from 1981 to 1991 was $\$ 35,800$. Among all households, family income amounted to $\$ 27,800$ (figure 25).
Owners living in housing built in the last decade had a family income of $\$ 45,400$. This was $\$ 10,600$ or 30 percent higher than the comparable median family income of all homeowners ( $\$ 34,800$ ). Renters who lived in housing built since 1980 had a 1991 median family income of $\$ 23,300$. This was 25 percent higher than the income of all renters $(\$ 18,700)$.

## Households in newer units paid more per month for housing and spent more of their income on shelter than all households

The median monthly housing cost for units built in the last decade was $\$ 650$. Among all households, the median cost was $\$ 459$ per month. Households living in housing built since 1981 spent approximately 24 percent of their current family income on costs for housing. Among all households, the proportion of income that was spent on housing was about 22 percent.
Among owners living in homes built in the last decade, the median monthly housing cost was $\$ 771$. This accounted for approximately 22 percent of their current family income. For all owners, median costs were
about $\$ 455$ per month for housing, or 19 percent of their income. Renters living in units built after 1980 spent a median of $\$ 560$ per month on costs associated with housing. This represented a median of 27 percent of their current family income. Among all renters, housing costs per month were about $\$ 462$. The proportion of their income consumed by housing costs was somewhat higher (28 percent) than that of householders in newer units (table 5). ${ }^{17}$

[^11]
## Part 4 <br> Vacant Units

## Characteristics of Vacant Units

## Seven out of ten year-round vacant units are in metropolitan areas, with a fairly even mix between cities and suburbs

There was a total of 11.4 million vacant housing units in the United States in 1991. Most of these were vacant year round ( 8.7 million or 76 percent), while 2.7 million were seasonal or occupied only part of the year. About 72 percent of all year-round vacant units were located within MSA's. These vacant units were equally distributed between suburbs and central cities (about 36 percent each) (table 1).

## Vacancy rates are highest in the South

Approximately 44 percent, or 3.9 of the 8.7 million year-round vacant housing inventory is in the South. The Northeast hosts the fewest, or about 16 percent of vacant units (table 1). The South also has the highest vacancy rate, containing the highest proportion of year-round vacant units. About 11 percent of all units in that region are vacant year-round.

About half of all non-seasonal vacant units were either on the housing market for rent or for sale or recently rented or sold and awaiting occupancy
Approximately 4.5 of the 8.7 million year-round vacant housing units were either on or just off the market. About 31 percent (2.7 million) of year-round vacant units were for rent (some of which may have been offered for sale). Approximately 12 percent
( 1.0 million units) were for sale only. About 9 percent ( .8 million) were already either rented or sold and awaiting occupancy (figure 24).

The remaining 4.3 million yearround vacant units were not on the housing market. Of all yearround vacant units, 30 percent were used occasionally or were

Figure 24.
Types of Year-Round Vacant Housing Units: 1991

Figure 25.
Duration of Vacancy for Year-Round Vacant Housing Units on the Housing Market: 1991
(In percent)

occupied by householders with their usual residence elsewhere. ${ }^{18}$ About 19 percent were other types of vacant units including those held for settlement of an estate, occupied by a caretaker or janitor, or held for personal reasons of the owner. ${ }^{19}$

The typical year-round vacant housing unit is 26 years old and has 1,270 square feet of living space with 4.3 median rooms including 2.0 bedrooms
The largest proportion of yearround vacant units was in structures of two or more units (44 percent). Another 40 percent were single detached units, 7 percent were single attached units, and a similar proportion were mobile homes. Most vacant units that were for sale only were single-unit

[^12]structures ( 74 percent). Most units that were for rent or sale were in multi-unit structures (70 percent) (table 6).

Of the year-round vacant units, about 11 percent were cooperatives or condominiums. About 22 percent of all yearround vacant units held for occasional use or with a householder who had a usual residence elsewhere were cooperatives or condominiums.

The median age of year-round vacant units was 26 years.
Those 1.6 million vacants classified as other were the oldest type of vacant unit with a median age of 42 years. Vacant units that were for occasional use or having householders with a usual residence elsewhere were the newest with a median age of 19 years.
There were medians of 4.3 rooms and 2.0 bedrooms among all year-round vacant housing units. Vacant units for sale only had more rooms than any other type of vacant unit ( 5.3 median rooms). Units for rent had the fewest number of median rooms (3.9).

Vacant units had about 1,270 square feet of median living space. ${ }^{20}$ Units that were for
rent were likely to have less living area (about 1,000 square feet) than other types of yearround vacant units. Generally, vacant units for sale or awaiting occupancy had the most living space (approximately 1,570 square feet).
Year-round vacant units for sale or already sold had a median value of $\$ 68,300$. Vacant housing units located in the Midwest had the lowest median value $(\$ 45,300)$.

## About one-quarter of vacant units for sale were on the housing market for at least 1 year

A third (34 percent) of all yearround vacant units that were for rent had been vacant for less than 1 month. About another third were for rent and vacant for 1 to 6 months. Among those year-round vacant units that were only for sale, 11 percent were vacant for less than a month, 30 percent for 1 to 6 months, 16 percent for 6 months to a year, and about a quarter (24 percent) for a year or more.

## Source and Accuracy of the Estimates

## Source of the Data

All estimates in this publication are based on data from the 1991 American Housing Survey- National (AHS-N) sample. The Bureau of the Census conducts this survey biennially, acting as collection agent for the Department of Housing and Urban Development.

The sample for the AHS-N survey was spread over 394 sample areas (called primary sampling units) comprising 878 counties and independent cities with coverage in 50 States and the District of Columbia. We selected about 56,700 housing units for interview in 1991. We increased the number of sample housing units in rural areas by 50 percent in the 1991 enumeration. Also, we conducted a large- scale Computer Assisted Telephone Interviewing experiment as part of the 1991 enumeration for AHS-N. For more details about the sample design of AHS-N, refer to appendix B of the report American Housing Survey for the United States in 1991 (Current Housing Reports, series H150/91).

## Estimation Procedures

The AHS-N sample estimation procedure adjusted weighted sample estimates of the United States housing inventory by tenure, race/ethnicity of householder, age of householder, household status, and geographic region. We based these independent estimates on statistics from the 1990 decennial census and the Current Population Survey, a monthly survey we conduct for the Bureau of Labor Statistics to provide monthly labor force data.

We used controls based on the 1990 census which are about 2.5 percent lower than the 1980based controls used in previous reports. The method for computing the controls is also different. As a result, estimates of change from this report compared to previous reports may be understated by about 2.5 percent.
Refer to appendix B of the report, American Housing Survey for the United States in 1991 (Current Housing Reports, series H150/91) for more details about the estimation procedure and controls of 1991 AHS-N.

## Accuracy of the Estimates

Since estimates in this publication are based on samples, they may differ from the results that would have been obtained if a complete census had been taken under the same interviewing conditions. Estimates from sample surveys have two possible types of errors: nonsampling and sampling errors. The accuracy of survey estimates depends upon the net effect of nonsampling and sampling errors.

## Nonsampling Errors

Nonsampling errors may be attributed to many sources and occur during all stages of the survey process. They include:
a. Inability to obtain information about all cases,
b. Definitional difficulties,
c. Differences in interpretation of questions among respondents,
d. Inability or unwillingness to provide correct information on the part of the respondents,
e. Mistakes in recording or coding the data,
f. Other errors of collection, response, processing, coverage, and missing data information.

## Sampling Errors

Sampling error reflects the difference between sample estimates and the actual value. NOTE: By the term "actual value" we mean the value we would receive by interviewing all housing units, instead of a sample, under the same conditions.

For example, suppose based on responses from the sample households we estimate $1,300,000$ housing units with a certain characteristic. Since we only interviewed a sample of all households, there is a certain amount of "sampling error" in this estimate. Due to the sampling error, if we conclude the actual value is between $1,263,000$ and $1,337,000$ (a 50 - percent confidence interval), there is only a 50 percent chance we'll be correct.

Use the formulas in tables 1-A through 1-C to determine the estimated error of a sample estimate from the AHS-N data.
The letter " $A$ " in the formula represents the publication estimate. Use the number as it appears in the publication (i.e., do not multiply the estimate by 1,000 ).
The letter " $Z$ " determines the probability the actual value is within the range. The larger the value of $Z$, the larger the range, and the higher the probability the actual value will be in the range. The $Z$ value used in this publication is 1.6. This $Z$ value corresponds to a range with 90-percent level of confidence. If we conclude the actual value is in this range, there is a 90-percent chance of being correct. Note
when $Z=1.00$, the formula computes the standard error.
The values determined from the error formulas are approximations to the errors for the estimates in this publication. These approximations were necessary to produce errors applicable to a wide range of characteristics at a reasonable cost. The error formulas provide an indication of the order of magnitude of the errors rather than the actual errors for any specific characteristic.

The numbers in this book are printed in thousands (i.e., 21 printed in the book means 21,000 homes). The errors are also computed in thousands (i.e., don't multiply the number in the publication by 1,000 before computing the error).

We used hypothesis tests to test differences between characteristics. All statements of comparison in the text passed a hypothesis test at the 0.10 level of significance. This level indicates that the probability of concluding that the characteristics are different when they are actually the same is 0.10 . The absolute value of the estimated difference between characteristics is greater than or equal to 1.6 times the standard error of the difference at this level of significance.

We provide five error calculation examples for illustrative purposes. These estimates do not correspond to any specific estimates found among the various AHS-N publications.

## Publication Estimates

The following example illustrates the use of the error formula for publication estimates. Suppose in the United States there are 1,300 elderly households of a certain type (meaning 1,300,000
households since the publication number is in thousands). To compute the range of the error (a confidence interval), use the first formula in table 1-A, $A=1,300$ and $Z=1.60$. Compute the error of the publication estimate as follows:

$$
\begin{gathered}
Z \times \sqrt{(2.288 \times A)-\left(.000022 \times \mathrm{A}^{2}\right)} \\
=1.60 \times \sqrt{2974.4-37.18} \\
=87
\end{gathered}
$$

The actual value with a 90-percent level of confidence ( $Z=$ 1.60 ) is between 1,300 plus or minus 87 , or in the range 1,213 to 1,387 (which means 1,213,000 to $1,387,000$ since the numbers are in thousands). If we conclude the actual value is in this range, there is a 90-percent chance of being correct.

If the estimate involves two characteristics from tables 1-A through 1-C, use the formula with the larger first number under the square root. For example, for mobile homes in the South, use the formula for the South since 2.435 is larger than 2.076.

## Percents

The formula for computing the error of a percent is the following:

where
$Z$ defines the confidence the range will include the actual value,
$Y$ is the number from the last column of Tables 1-A - 1-C (chosen based on the denominator),
$P$ is the percent calculated, and
$B$ is the denominator of the percent.

For example, suppose there are 20,000 (actually 20,000,000) households in the Northeast and $8,000(8,000,000)$, or 40 percent, are renters. To compute the range of the error with a 90-percent confidence level, use $Z=$ 1.6, $Y=.935, P=40$, and $B=$ 20,000 in the above formula:

$$
1.60 \times .935 \times \sqrt{\frac{2.288 \times 40 \times 60}{20,000}}
$$

The actual percent of renters in the Northeast with a 90-percent level of confidence is between 39.2 and 40.8 percent. If we conclude the actual value is in this range, there is a 90-percent chance of being correct.

## Differences

People often ask whether two numbers are actually different. If the range of error for the difference does not include zero at a certain level of confidence, then we conclude the numbers are different at that confidence level. Compute the range of error for the difference of two numbers, $A$ and $B$, as follows:

$$
\sqrt{(\text { error of } A)^{2}+(\text { error of } B)^{2}}
$$

This formula is accurate for either of the following types of differences:
a. The difference between estimates of the same characteristics in two different areas.
b. The difference between separate and uncorrelated characteristics in the same area.

The formula overestimates the error if a high positive correlation exists between the two characteristics. The formula underestimates the error if a high negative correlation exists between the two characteristics.

The following illustration shows how to compute the error of a difference. Suppose there are $12,000(12,000,000)$ owneroccupied units in the Northeast and $8,000(8,000,000)$ owner-occupied units in the Midwest. The respective errors for a 90 - percent confidence interval are 162 and 178. The error for a 90 -percent confidence interval for the 4,000 $(4,000,000)$ difference is the following:

$$
\sqrt{(162)^{2}+(178)^{2}}=241
$$

The actual difference between owner- occupied units in the Northeast and Midwest is between 3,759 and 4,241 . If we conclude the actual difference is in this range, there is a 90 -percent chance of being correct. Since the range does not include zero, we conclude these two estimates are different at this level of confidence.

## Medians

The median is the value 50 -percent of the way through the distribution. So, 50-percent of the total falls below and 50-percent falls above the median. A range around the median can be constructed by computing the error on a 50 -percent characteristic and translating that into an interval for the characteristic.
We calculated some medians and their standard errors in this report. A 90-percent confidence interval for these medians can be made by multiplying the standard error by $Z=1.6$.

Use the following procedure to estimate the upper and lower limits of a confidence interval for a median:

1. Using the error formula for percents, compute the error of 50 percent. The total number of
housing units from the distribution is the denominator in the formula. Subtract "not reported" or "don't know" categories from the total.
2. Calculate the confidence interval for 50 percent by adding and subtracting the error, from step 1, to 50 percent.
3. Translate the confidence interval for 50 percent to an interval for the characteristic. The lower and upper endpoints for the confidence interval represent the percent of cases that fall below the respective endpoints of the interval for the characteristic. These values are found by linearly interpolating within the appropriate intervals of the distribution.

The probability the actual median is within the interval depends on the value of $Z$ in the error of percent formula.

The following example shows how to compute a 90 -percent confidence interval for a median. Suppose that the median number of rooms is 2.8 rooms. The number of housing units in the distribution of number of rooms is presented below.

## Distribution of Number of Rooms

| Number of <br> rooms | Number of <br> housing units <br> (in thousands) |
| :--- | ---: |
| Total | 56,000 |
| 1 | 900 |
| 2 | 20,000 |
| 3 | 22,000 |
| 4 | 8,000 |
| 5 | 4,100 |
| Not Reported | 1,000 |

1. The error on a 50 -percent characteristic based on 55,000
$(55,000,000)$ housing units is calculated as follows:

2. Calculate the lower and upper percent limits by subtracting and adding 0.5 from 50 percent. These values are equal to 49.5 and 50.5 percent.
3. So, 49.5 percent of the housing units have less rooms than the lower endpoint of the 90 percent confidence interval. Thirty-eight percent of the households have 2 or less rooms and 78 percent have 3 or less rooms. (Remember to subtract the number of "Not Reported" housing units from the total.) The value corresponding to 49.5 percent of the households is between 2.5 and 3.5. The equation for linear interpolation of the value is the following:

$$
\begin{gathered}
2.5+(3.5-2.5)\left(\frac{49.5-38.0}{40.0}\right) \\
=2.79
\end{gathered}
$$

where
2.5 is the upper endpoint of the interval of the distribution below the interval containing the value corresponding to the 49.5 percent,
$3.5-2.5$ is the length of the interval corresponding to the 49.5 percent. Note that the category ' 3 rooms' is represented by the interval 2.51 to 3.5 ,
49.5 is the lower endpoint of the confidence interval for the median,
38 is the percent of cases falling below the interval corresponding to 49.5 percent, and

40 is the percent of cases within the interval corresponding to 49.5 percent.
Similarly, calculate the upper endpoint of the confidence interval according to the following:

$$
\begin{gathered}
2.5+(3.50-2.50)\left(\frac{50.5-38.0}{40.0}\right) \\
=2.81
\end{gathered}
$$

The actual median with a 90-percent level of confidence is between 2.79 and 2.81. If we conclude the actual median is in this range, there is a 90 -percent chance of being correct.

## Ratios

The formulas for estimated percentages underestimate the error of a ratio of two numbers (AB) when either of the following two situations occur:
a. There is little or no correlation between A and B .
b. $A$ is not a subclass of $B$.

A better approximation of the error for a ratio is the following:

$$
\left(\frac{A}{B}\right) \sqrt{\left(\frac{\text { error of } A}{A}\right)^{2}+\left(\frac{\text { error of } B}{B}\right)^{2}}
$$

where
$A=$ numerator of the ratio
and
$B=$ denominator of the ratio.
The following illustration shows how to compute the error of a ratio. Suppose there are 12,000 $(12,000,000)$ owner-occupied units in the Northeast and 8,000 $(8,000,000)$ owner-occupied units in the Midwest. The ratio of own-
ers in the Northeast to owners in the Midwest is 1.5 . That is, there are one-and-a-half times as many owners in the Northeast as in the Midwest. The respective errors for a 90-percent confidence interval are 162 and 178 (use the formula for general characteristics for the Northeast and Midwest, respectively). The error for a 90 -percent confidence interval for the ratio is the following:

$$
\frac{12,000}{8,000} \sqrt{\left(\frac{162}{12,000}\right)^{2}+\left(\frac{178}{8,000}\right)^{2}}=.039-2
$$

The actual ratio with a 90-percent level of confidence is between 1.461 and 1.539. If we conclude the actual ratio is in this range, there is a 90-percent chance of being correct.

Table 1-A.
Items Not Listed in Table 1-B or 1-C (i.e., General Characteristics)

${ }^{1}$ Use for the following Hispanic deficiency items: water supply stoppage in last 3 months and no toilet working in the last 3 months.

Table 1-B.
Neighborhood, Heating/Cooling Equipment, and Fuel Characteristics

| Characteristic | Publication estimates | Percentages |
| :---: | :---: | :---: |
|  | The error is the larger of: | Value of $Y$ for percent formula |
| Other neighborhood and heating/cooling equipment and fuel not listed below. | $Z \times \sqrt{2.829 \times A-.000027 \times A^{2}}$ or $Z \times 3$ | 1.112 |
| Northeast . | $Z \times \sqrt{2.829 \times A-.000134 \times A^{2}}$ or $Z \times 3$ | 1.112 |
| Midwest. . | $Z \times \sqrt{2.829 \times A-.000113 \times A^{2}}$ or $Z \times 3$ | 1.112 |
| South | $Z \times \sqrt{4.805 \times A-.000130 \times A^{2}}$ or $Z \times 5$ | 1.449 |
| West | $Z \times \sqrt{3.344 \times A-.000155 \times A^{2}}$ or $Z \times 3$ | 1.209 |

Table 1-C.
Special Items

| Characteristic | Publication estimates | Percentages |
| :---: | :---: | :---: |
|  | The error is the larger of: | Value of Y for percent formula |
| Other Special Characteristics not listed below . | $Z \times \sqrt{4.805 \times A-.000046 \times A^{2}}$ or $Z \times 5$ | 1.449 |
| Black . | $Z \times \sqrt{5.680 \times A-.000524 \times A^{2}}$ or $Z \times 6$ | 1.576 |
| Hispanic | $Z \times \sqrt{5.680 \times A-.000054 \times A^{2}}$ or $Z \times 6$ | 1.576 |
| Vacant. | $Z \times \sqrt{4.805 \times A-.000046 \times A^{2}}$ or $Z \times 5$ | 1.449 |

Note: Special items include all characteristics pertaining to cooperatives or condominiums; and no complete bathroom.

## .

[^0]:    ${ }^{1}$ MSA's shown in the AHS are defined as areas that qualify in two ways: if there is a city of at least 50,000 population, or a Census Bureau-defined urbanized area of at least 50,000 with a total metropolitan population of at least 100,000 ( 75,000 in New England). Except in the New England States, an MSA is defined in terms of entire counties. In New England, MSA's are composed of cities and towns. In addition to the county containing the main city, additional counties are included in an MSA if they are socially and economically integrated with the central county. An MSA may contain more than one city of 50,000 population and may cross State lines.
    See appendix $A$ of the current publication American Housing Survey for the United States, series H150, for a specific and complete discussion of many of the terms and definitions used throughout this report.

[^1]:    ${ }^{2}$ The householder is the person who owns or rents an occupied housing unit.

[^2]:    ${ }^{3}$ Classification of race and Hispanic (Spanish) origin in the AHS publications refer to the race and Hispanic origin of the householder occupying the unit. Information pertaining to race and ethnicity are asked of all persons and collected through separate questions in the AHS. Householders of Hispanic origin may be of any race.

[^3]:    ${ }^{4}$ Proportions that do not differ significantly: middle-aged Black homeowners (54 percent) compared with middle-aged Hispanic owners (52 percent); Black elderly owners ( 64 percent) compared with elderly Hispanic homeowners (59 percent).
    ${ }^{5}$ A family includes the householder and one or more other members of the household related to the householder by either blood, marriage, or adoption.

[^4]:    ${ }^{8}$ Central main heating systems includes units with a warm-air furnace, steam or hot water system, electric heat pump, built-in electric units, and floor, wall, or other built-in hot air units without heating ducts.

[^5]:    ${ }^{9}$ Severe physical problems include specific critical problems with one or more of the following: plumbing, heating, electricity, upkeep, or hallways.
    Moderate problems include any of the less extensive problems including: plumbing, heating, upkeep, hallways, or kitchen. See appendix A in H150/91, American Housing Survey for the United States in 1991, for detailed descriptions about requirements for physical problems.

[^6]:    10Low-income households estimate households in poverty and differ from official estimates of poverty based on data collected by the Current Population Survey (CPS). The AHS's poverty definition is based on household income. Questions asked about income are less detailed than those asked in the CPS survey whose poverty estimates are based on income of the family or the income of the primary individual. See appendix $A$ in the Current Housing Report, series H150/91, for a more detailed discussion about how these two approaches differ. Because of the AHS's variations from the official definition, data from the AHS will be discussed in terms of households with low income rather than the number of poor households, or households in poverty. The proportion of low-income renters ( 24 percent) is not significantly different from the proportion of young low-income renters (23 percent).

[^7]:    ${ }^{11}$ Food stamp recipiency was only asked for families or primary individuals with incomes of $\$ 25,000$ or less.

[^8]:    X Not applicable.
    ${ }^{1}$ Includes households in units owned by public housing authority, subsidized by Federal or State government, or income verification.
    ${ }_{2}$ AHS definition of poverty based on household income.

[^9]:    ${ }^{13}$ Monthly housing costs for homeowners include monthly payments for mortgages or installment loans and contracts, if any, and real estate taxes, property insurance, homeowners association fee, cooperative or condominium fee, mobile home park fee, land rent, utilities, fuels, and garbage and trash collection.
    ${ }^{14}$ Monthly housing costs for renters are calculated only for units occupied for payment of cash rent and include contract rent plus the estimated average monthly cost of utilities, fuels, property insurance, mobile home land rent, and garbage and trash collection paid by the renter.

[^10]:    ${ }^{15}$ The median monthly housing cost for owners with a mortgage (\$761) is not significantly different from the median housing cost for middle-aged owners with a mortgage (\$762).
    ${ }^{16}$ Households having over 30 percent of their income going towards housing normally signify high housing costs.

[^11]:    ${ }^{17}$ Median housing costs for all occupied units (\$459), all owner-occupied units (\$455) and all renter-occupied units (\$462) are not significantly different.

[^12]:    18 Vacant units in this category include those held for occasional use such as those occupied for weekends throughout the year. The intent of this question is to identify homes reserved by their owners as second homes. Because of the difficulty in distinguishing between this category and seasonal vacancies, it is possible that some second homes are classified as seasonal and vice versa.
    ${ }^{19}$ The proportion of year-round vacant units either on or just off the market (31 percent) is not significantly different from the proportion that were used occasionally or had householders with a usual residence elsewhere (30 percent).

[^13]:    ${ }^{20}$ Data for square footage is only collected for single detached units and mobile homes. Therefore discussion of this characteristic only applies to these types of units.
