

## MOBILITY

This section includes information for recent movers in all surveys and questions on lifetime and planned mobility for selected years. The definition of recent movers changed starting in 1984 (see definition below) but the types of data available are generally the same: data on previous residence and reasons for move. It should be noted that this information is available only for households who moved into a sample unit from another place of residence. It does not include information for households who left a sample unit, since the AHS samples units, not households. Up through 1983, the data indicated whether a change in household composition had occurred as a result of the move to the new unit, by stating whether the reference person was also the reference person in the previous unit and by providing information to compare the number of individuals who lived in the previous unit and the number of individuals living in the sample unit. Starting in 1984, the AHS asks a series of detailed questions for each household member which determine whether all household members were already living together before the move. If not, subgroups of the household who came from different previous residences are identified. Information on the location and selected characteristics of each group's previous residence is available. These data can be used to study household formation. Data on reasons for moving are available in 1984 and later only if the respondent moved into the unit after 1979 (or moved in past year for 1973-1983 surveys). The questions on reason for moving in the 1984 and later surveys are similar to the questions asked up through 1983. The reasons for selecting a particular house/apartment are more specific and provide information on the characteristics of the unit which influenced the household choice. Data on mobility (residence at age 16 and planned residence for the future) are only available in selected years. Starting in 1984, the mobility questions are asked only if the respondent moved in 1980 or later.

Recent Mover--Up through 1983, a household was considered a recent mover if the reference person moved into the sample unit within the last 12 months. Starting in 1984, data on recent movers are available if at least one household member moved into the unit in 1980 or later. Census publications continue to define a household as recent movers if the reference person moved to the unit in the last 12 months. The availability of data for each person who moved allows the user of AHS data files to use a definition appropriate for a specific analysis.

Date reference person/other household members moved into unit--the data are based on the information reported by the reference person and refer to the date of the most recent move. Thus, if the reference person moved back into a housing unit previously occupied, the date of the most recent move is to be reported; if the reference person moved from one apartment to another in the same building, the date the reference person moved into the present housing is to be reported. The intent is to establish the date the present occupancy by the reference person began. The date the reference person moves is not necessarily the same date other members of the household

move, although in the great majority of cases, the entire household moves at the same time. Starting in 1984, a move date is available for each household member.

The variable IMONTH in the Sample Status Section shows when each interview was conducted for the SMSA survey. However, the date when the reference person moved into the unit cannot be compared to date of interview to determine clearly whether the household is the same as the one interviewed the year before, because people do not always remember accurately when they moved, and the head may have moved before or after the rest of the household. The variable HHLID (see Sample Status Section) should be used to determine if the household is the same as the one interviewed the year before, although this variable has not yet been released for all survey years and some problems have been identified with the coding of the variable.

The AHS cannot be used to measure directly the number of moves that happen in any particular time period, because not all of these moves show up in the file. For example, a unit with more than one family moving in and out during a year will show up with only one mover in the survey. Similarly, a move into a unit which is abandoned later in the year will not be counted in the survey. For these reasons, the AHS cannot be used to measure accurately the average time between moves for American families, since it omits multiple moves during a year, and it omits moves out of the housing stock, such as into nursing homes or other institutions.

The variable RMYEAR (until 1983) or other variable created by a user starting in 1984 accurately counts the number of current heads of household who have moved at least once during a year. However, it does not attempt to measure all moves by those heads of household during the year. Starting in 1984, the availability of a move date for all household members enables users to identify moves by other household members. It still, however, does not provide information to identify multiple moves within a year by a specific person.

The longitudinal file merges data from a least two interview, so it has at least two chances to record a move. This gives it better coverage of multiple moves by the same person, and of movers who die or otherwise cease being heads of household. Naturally, however, even the longitudinal file is incomplete by an unknown amount if one is trying to count all moves throughout the year. To get that statistic one would have to conduct the survey numerous times throughout the year or use statistical techniques such as the ones used to estimate life expectancy.
